

J&J Air Systems

Operator and Service Manual

VT, VTS & VTH Series

BAMBI

Operating Manual

**Your Bambi Air Compressor is a precision engineered product.
By following these simple steps you will ensure years of trouble free use.**

Parts & Service are available from your Bambi dealer.

It is important to quote Model, Type & Serial Number in all communications.

The substitution of parts not manufactured nor approved by Bambi can impair performance, service life and create potential mechanical or personnel hazards and will invalidate your warranty.

Bambi reserves the right to modify the contents of this operating booklet without notice and the information is in no way binding on the company.

Warranty

Provided the operating instructions have been followed, and the compressor has been properly maintained, Bambi VT and VTS compressors are guaranteed against faulty workmanship for a period of 2 years.

The air receiver is guaranteed for 5 years.

The guarantee does not cover damage by misuse, incorrect parts or service.
Contact Bambi Air Ltd or your retailer for further information.

1) Safety Precautions

What you **must** do:

- Read these instructions before using your air compressor.
- Ensure the compressor has been installed, electrically connected and piped in by a properly qualified person.
- Ensure the compressor is kept upright at all times.

What you **must not** do:

- Do not attempt any maintenance on the compressor until it has been isolated from the power supply.
- Do not attempt any work on the compressor until the air receiver and pipe work systems are depressurised.
- Compressed air is dangerous if misused and can prove fatal. Avoid any bodily contact with compressed air.
- During operation the motor will become quite hot to the touch. Avoid contact to prevent burns.
- Never tamper with the pressure relief valve.
- Never lubricate the oil free motor or pump assembly; this will cause severe damage.
- Never obstruct cooling fans or outlet vents.

2) Siting The Compressor

What you **must** do:

- Provide adequate protection from the weather.
- Site the compressor level in both planes.
- Larger models are heavy. Ensure the surface has sufficient load bearing capacity.
- Allow access for maintenance all around the compressor.
- Site in a dry area, avoiding damp or humid conditions. The site must be dust free, well ventilated and have a cool ambient temperature. 40°C should be regarded as the maximum allowable ambient.

What you **must not** do:

- Enclose the compressor or allow hot air generated by the motor to re-circulate around the compressor. Ensure there is 30cm clearance around the compressor
- Restrict air flow around the after cooler, after cooler fan unit or end cover ventilation [S models].

Important ! For Silenced VTS Models:

These compressors generate heat. Never restrict any of the ventilation grilles otherwise serious damage may occur.

Electrical Connections

Where applicable, compressors are supplied with a moulded plug in accordance with national standards.

Never remove the moulded plug.

The use of extension cables is not recommended as this may cause voltage drops which can result in damage to the motor.

Note !

Duplex models VT300/300D, VT400/400D must be connected to a dedicated fused 20 amp supply.

Wired in accordance with European Standard –

Single phase: Blue = neutral, Brown = live, Yellow & Green Stripe = earth

Three phase: Brown/Black/Grey = Phase conductors

Blue = Neutral

Yellow and Green Stripe = earth

Three phase compressors should be connected by a competent person

All three phase units require neutral supply

3) Unpacking Instructions for:

VTS75 / VTS150 / VTS200/ VTS250

3.1) Fitting Mounting Castors

Before using the compressor you must remove the external packaging and fit the castors supplied as they also provide essential clearance for the lower cooling fan exhaust.

Note !

Failure to do so will cause damage and invalidate your warranty

Remove the four bolts securing the compressor to its wooden packing, carefully lift the compressor to enable you to screw in the four castors using the same mounting holes.

Take care lifting the compressor, some models are heavy.

3.2) Removing Internal Transit Packing

Before using the compressor you must remove the internal packing, failure to do so will cause damage to the compressor. The procedure is as follows -

VTS75/150/200

Fig 1.

Using the hex key provided, remove the 3 bolts fixing the left hand end cover in place (when viewed from the front) – see fig 1.

There are three packing pieces, two either side of the pump unit, one on top of the cooling fan assembly.

Ensure that these are removed.

Reassembly is a reverse of the above but do not over-tighten the cover fixing bolts.

3.3) Fitting Condensate Bottle – VTS Dryer models only

Fig.2 - VTS Condensate bottle position

Push the black plastic condensate tube which emerges from the front panel into the hole in the lid of the bottle. As on Fig. 2

Fit the exhaust silencer to the condensate tube by pushing firmly on to the end of the tube.

Re-fit the bottle lid.

VTS250D

Using the hex key provided, remove the 4 bolts fixing the top cover in place and remove the top cover - see fig 1a.

There is one packing piece on the top of the pump unit.

Fig 1a.

Ensure that this is removed.

4) Operation

Refer to exploded parts diagrams and illustrations when reading this section.
Airline should be fitted to the regulator outlet.

Note ! For VTS Models

Ensure the transit packing has been removed as described in the previous section.
Failure to do so will cause damage and invalidate your warranty

4.1) Starting & Stopping

Plug the compressor into an outlet socket of nominal voltage and fitted with the correct fuse as shown in section Electrical Connections.

Switch the compressor on (I) using the on/off switch located on the front panel or pressure switch - see fig 3 pictures:

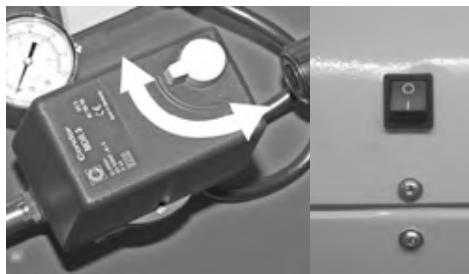

Fig. 3 On off switch versions

The compressor will start running and automatically switch off at the preset pressure.

Note!

Duplex Models VT300/300D, VT400/400D are fitted with a sequential start system to reduce electrical loading. You will notice one motor starting a few seconds after the other [single phase only]. This is normal.

As air is used the pressure drops and the motor will restart at the preset pressure.
Approx 2 Bar differential.

Note !

Each time the compressor switches off or the power supply is interrupted, you will hear a short hiss of air. You are hearing the unloader valve discharging the residual delivery pipe pressure. This is normal.

4.2) Adjusting Outlet Pressure

Use the pressure regulator to adjust the outlet pressure.

To increase line pressure, rotate the black knob next to the pressure gauge in a clockwise manner, to decrease turn anti clockwise. It is possible to lock the setting by pushing the knob down until it "clicks" home – see fig 4.

Fig 4: Gauge layouts

On cabinet [VTS] models, gauges are labelled.

On others:

The smaller gauge is SELECTED pressure
The larger is RECEIVER pressure

5) Routine Maintenance

Refer to preventative maintenance section for frequency.

5.1) Draining the Air Receiver

Drain condensate from air receiver at a pressure of no more than 2 Bar.

Slowly open the red coloured drain tap provided to allow water to flow out – see fig 5.

Fig. 5 Drain tap types

Close drain tap when all water has drained off. Draining is not required on dryer equipped models.

Automatic drains where fitted do not require draining, however the condensate tank will require emptying – see following section “Operation Dryer Models”.

Note !

Waste condensate must be handled in accordance with national environmental rules.

5.2) Check Pressure Relief Valve

Ensure the air receiver is not pressurised. On “S” models, refer to section 8: Removing Housing Cover

Unscrew the knurled end of the pressure relief valve until an audible “click” is heard. Retighten without using excessive force.

Fig. 6 Pressure relief valve positions

6) Operation – Dryer Models

When equipped with an air dryer unit, the compressor will automatically dry the compressed air before it is stored in the air receiver. This happens automatically and requires no additional maintenance. This eliminates the need to manually drain the air receiver.

Operation is similar to standard versions with the following change :-

Each time the compressor switches off or the power supply is interrupted, the dryer purge valve opens and automatically activates the drain valve on the after cooler filter allowing the dryer tower to regenerate. All accumulated moisture will discharge into the condensate tank.

This should be emptied when it reaches 3/4 full.

Fig. 7 Condensate tank locations

Do not exceed the recommended 50% duty cycle, otherwise the dryer will not activate and the humidity of the air will increase.

Ensure the after cooler fins are kept clear of accumulated dust.

7) Technical

We recommend the compressor has a maximum 50% duty cycle to prolong pump life.

Note !

The motor must never be allowed to run continuously otherwise it will overheat and may become damaged.

Do not ignore air leaks. All air connections must be leak free to prevent the compressor from over heating.

The compressor is fitted with 2 thermal overloads. In the event of excessive temperature the compressor will switch off and the external thermal protector will activate. To re-set follow the procedure below-

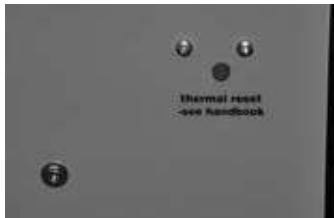

Models: VT[H]75/75D, VT[H]150/150D, VT[H]200/200D, VT250/250D

Switch off at the pressure switch [see Fig. 2]. Allow 50 minutes for the motor to cool down then switch back on at the pressure switch. The compressor will now restart.

Models: VTS75/75D, VTS150/150D, VTS200/200D, VTS250/250D

Do not switch the compressor off after overheating as this will prevent the internal cooling fans which reduce the temperature inside the housing from running.

Allow 50 minutes for the motor to cool down.

Press the thermal re-set button, you will hear an audible click – see fig 7.

The compressor will now restart.

Models: VT300/300D, VT400/400D

The re-set is integral with the pressure switch.

The pressure switch will automatically turn off (0) in the event of motor overload.

Turn the pressure switch to the on position [see Fig. 3].

The compressor will now restart.

If the compressor still does not run, switch off immediately and disconnect from the mains supply.

You **must** find the cause of the overload and rectify this before continuing to use the compressor.

Check for -

- Drain tap not closed properly
- Air leaks on the pneumatic fittings
- Compressor not the correct size for the work load
- Cooling fan outlets restricted

Contact your service engineer to investigate the cause.

8) Removing Housing Cover (VTS Models Only)

For routine maintenance it may be necessary to remove the top cover. Adhere to the following procedure:

Models: VTS 75/75D, 150/150D, 200/200D

Disconnect from the mains power supply and release all the air from the compressor and the air system.

Using the hex key provided, remove the 3 bolts fixing each end cover in place and remove the end covers.

Remove the bolts holding the top cover in place.
Gently lift up the top housing.

Note !

Do not use excessive force as this will strain the electrical and air connections.

Carefully pull apart the electrical multi connector by squeezing the side clips and gently pulling the connector apart. Do not use excessive force.

To release the air connections, push the connector collar in and simultaneously pull the air tube out.

Reassembly is a reverse of the above but check that -

- The air tubes are pushed fully home into the connector and seal
- The electrical connector is secure
- No wires or air tubes are trapped in the housing join

Models: VTS250/250D

Disconnect from the mains power supply and release all the air from the compressor and the air system

Using the hex key provided, remove the 4 bolts fixing the top cover in place and remove the top cover.

SERVICE KITS

BPVT 1 Service Kit covers models:

VT75 / VT150 / VT250 (2 kits) VT300 (2 kits) – including H/D/S variants

BPVT2 Service Kit covers models:

VT200 and VT400 (2 kits) - including H/D/S variants

BPB0655 required to change the Coalescing Filter Element

BPDSK Service Exchange Dryer

AIR DRYER PERFORMANCE

Where fitted, the air dryer unit was tested using a Michell Instruments C2TX Hygrometer

The test procedure was carried out in accordance with ISO8573-1 Class 9.2.9:2010 Class 9.2.9

Molecular Sieve Type BS4A 2.5/5.00mm

Test Result: -40 Degree Dew Point

Duty Cycle Time: Full Flow @50%

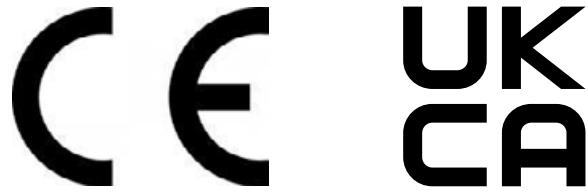

Performance: [100% pass]

NOTE: To ensure the optimum performance of your Bambi dryer please note that the desiccant and filter need to be changed every two years or if the Dew Point level is no longer achieved due to degradation of the desiccant in extreme working conditions.

When you require the best quality of Air for your Dental Surgery, or Medical use there is just one name to consider – Bambi.

With over 37 years in the manufacture of precision Air compressors, Bambi have developed the most comprehensive range of Dental, Medical and Scientific Air Compressors manufactured in the United Kingdom.

We supply the comprehensive range of Bambi Air Compressors available to meet the needs of the smallest rural Dental practice through to the largest multi room surgeries for NHS practices, including private Surgeries, Clinics and Laboratories.

Our team can assist with all the technical advice you need including selecting and specifying the correct Air Compressor for your needs, delivery options and installation requirements. Our Service Team can install and maintain your equipment in an efficient and safe condition and protect your 2 Year Warranty on your equipment, and 5 Year Warranty on the Air Receiver.
